Current Accelerator Complex at Fermilab

Fermilab Neutrino Program

Megawatt upgrade

LBNF/DUNE

Accelerator Capabilities Enhancement (ACE) overview and opportunities

- Main Injector Ramp & Targetry (MIRT)

Neutrino Beam challenges

- Targetry
- Beam Instrumentation

# Current Accelerator Complex at Fermilab

- Fermilab operates largest particle accelerator complex in USA, 6,800 acres of federal land
  - ~1,900 staff with a yearly budget of ~ \$600M
  - Hosts facilities utilized by over 4,000 scientists from 50+ countries
- Continues its mission to unravel mysteries of matter, energy, space, and time for global benefit

# NuMI Beamline

- Intense beam of muon-neutrinos aimed towards Minnesota
- Main Injector provides 50–70 trillion 120GeV protons every 1.2 seconds
  - Originally designed for 400 kW
- Each pulse generates  $\sim 2 \times 10^{14} \nu_\mu$ 
  - ~20 million pulses annually
- Commissioned in 2005, run until ~2027

# NuMI Megawatt Upgrade

|                    | NuMI Design          | NOvA                 | 1 MW upgrade         |
|--------------------|----------------------|----------------------|----------------------|
| Proton beam energy | 120 GeV              |                      |                      |
| Beam power (kW)    | 400                  | 700                  | 1 MW                 |
| Energy Spectrum    | Low Energy           | Medium Energy        |                      |
| Cycle time (s)     | 1.87                 | 1.33                 | 1.2                  |
| Protons per spill  | $4.0 \times 10^{13}$ | $4.9 \times 10^{13}$ | $6.5 \times 10^{13}$ |
| Spot Size (mm)     | 1.0                  | 1.3                  | 1.5                  |
| Beam pulse width   | 10 microsec          |                      |                      |

R. Zwaska | Next-Gen Accelerators at Fermilab | NAPAC 2022

- **Enhanced Beam Power:**
  - Upgraded from 400 kW to 700 kW with NOvA /Accelerator & NuMI Upgrades (ANU)
  - NuMI Megawatt Accelerator Improvement Project (AIP): 2018-2021
- **Extended Capacity:** Modified to accept up to 1 MW beam power
  - Upgrade of target, horns, and supporting systems to be capable of accepting 1 MW beam power through 2025
- **Completion in 2021:** Finished upgrades after three annual shutdowns for component replacement
  - Various upgrade done, beam  $\sigma$  on target = 1 – 1.5 mm
- **Power Milestone:**
  - Set a record of nearly 959 kW in May 2023
  - Demonstrated capability with 1.133s MI cycle run

# LBNF/DUNE

LBNF/DUNE-US Project provides

- Up to 2.4 MW proton beamline
- 1.2 MW target systems
- Up to 2.4 MW of shielding and absorber

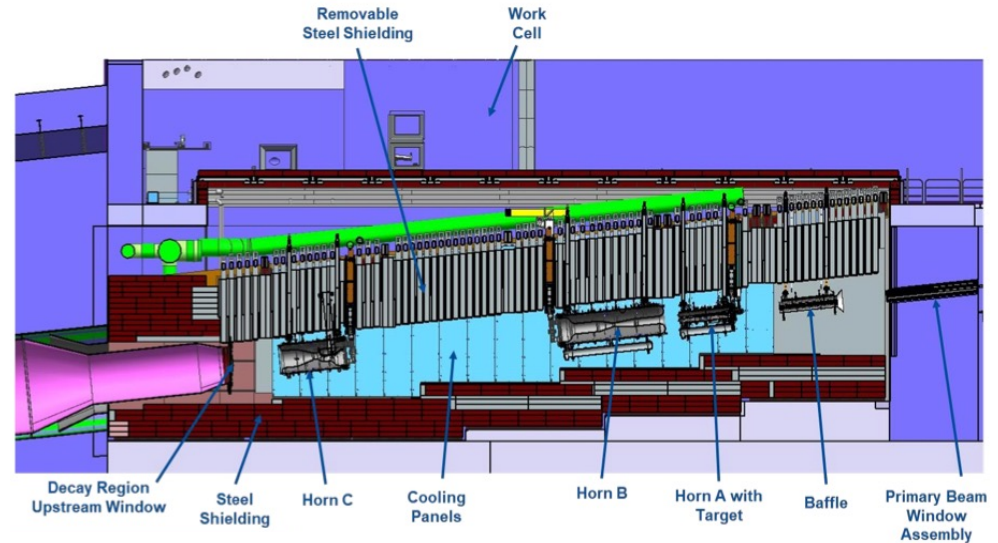

**DUNE: World's most powerful neutrino experiment, powered by PIP-II & LBNF**

| Capability Description                | Phase I | Phase II       |
|---------------------------------------|---------|----------------|
| <b>Beamline</b>                       |         |                |
| 1.2MW (includes 2.4MW infrastructure) | X       |                |
| 2.4MW                                 |         | X <sup>1</sup> |
| <b>Far Detectors</b>                  |         |                |
| FD1 – 17 kton                         | X       |                |
| FD2 – 17 kton                         | X       |                |
| FD3                                   |         | X              |
| FD4                                   |         | X              |
| <b>Near Detectors<sup>2</sup></b>     |         |                |
| ND Lar                                | X       |                |
| TMS                                   | X       |                |
| SAND                                  | X       |                |
| MCND (ND GAr)                         |         | X              |

**Note 1:** requires upgrades to LBNF neutrino target and upgrades to Fermilab accelerator complex. The LBNF facility is built to support 2.4MW in Phase I.

**Note 2:** Near Detector Subproject threshold scope provides "day 1" requirements to start the DUNE experiment

# Accelerator Capabilities Enhancement (ACE) overview and opportunities

From J. Eldred, JINST 2019

PIP-II upgrades will provide proton power of 1.2 MW (at max 1.35 MW)

Set maximum energy (E) to 120 GeV; one option is to boost beam pulse intensity (N), requiring additional 8 GeV upgrades to beam intensity

Other option is to **decrease MI ramp time**

$$P = \frac{eNE}{T}$$

- ACE upgrade: accelerate beam delivery to LBNF/DUNE via MI cycle time reduction – faster way to 2+ MW
- ACE-MIRT upgrade: Main Injector Ramp & Targetry: MI cycle time + improvements of Target Systems capabilities

# Accelerator Capabilities Enhancement (ACE) overview and opportunities

- DUNE sensitivities depend on exposure (kt\*MW\*yrs)
- Oscillation sensitivities depend on total Far Detector exposure
- ACE upgrade to 2+ MW optimizes 40 kT DUNE detector

Assume an initial capacity of 20 kt (Phase I; 2 FD modules), with an additional 10 kt module added in year 4 and another 10 kt module in year 8

# Accelerator Capabilities Enhancement (ACE) overview and opportunities

ACE-MIRT proposed to reduce Main Injector cyclor to  $\sim 0.65$ s to increase beam power

## In ACE-MIRT period:

- Significant beams at 0.8 GeV
- Less at 8 GeV (because of MI cycle time, absolute minimum slip stacking time is 0.65s)
- More beam power with 120 GeV slow extraction

From N. Tran, ACE Science  
Workshop, Fermilab Users  
Meeting 2023

ACE-MIRT

ACE-BR

Reduce Main Injector Ramp time  
+ Target R&D to get to > 2 MW

(Booster replacement)

|                       |         | PIP-II Booster |     |      |             |
|-----------------------|---------|----------------|-----|------|-------------|
| Operation scenario    | Nominal | PIP-II         | A   | B    | units       |
| MI 120 GeV ramp rate  | 1.333   | 1.2            | 0.9 | 0.7  | s           |
| Booster intensity     | 4.5     |                |     | 6.5  | $10^{12}$ p |
| Booster ramp rate     | 15      |                |     | 20   | Hz          |
| Number of batches     | 12      |                | 12  |      |             |
| MI power              | 0.75    | 1.2            | 1.7 | 2.14 | MW          |
| cycles for 8 GeV      | 6       | 12             | 6   | 2    |             |
| Available 8 GeV power | 29      | 83             | 56  | 24   | kW          |

# Neutrino Beam Challenges

## Beam Instrumentation

- Essential for smooth operation of accelerator complexes
- Impacted by immediate/cumulative radiation exposure, ambient temperature, humidity etc.  
e.g. NuMI Muon monitor<sup>1</sup> damaged by radiation
- Affects range of operational beam parameters, e.g. highest possible beam power
- Essential for reliable and efficient operations at higher beam power for future multi-MW facilities
- Fermilab, KEK/J-PARC collaborating on a global R&D efforts to enhance beam instrumentation

## Ideas for radiation hardened beam instrumentations

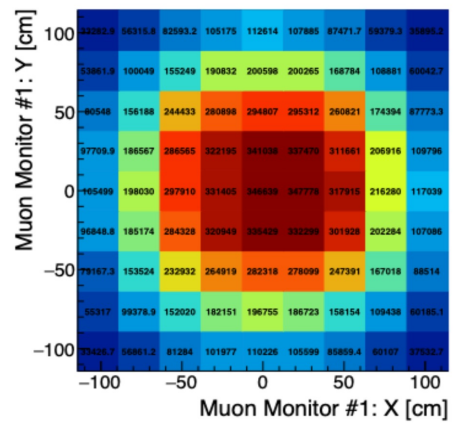

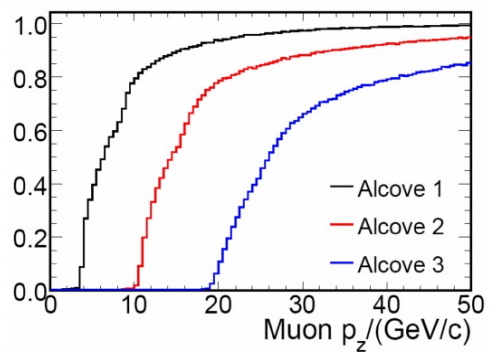

| Facility | Beam Energy  | Beam Power  | Instruments  |
|----------|--------------|---|--|
| LBNF     | 60 - 120 GeV | 1.2 MW -<br>2.4 MW<br>(50-70e12 protons per spill, 0.6-1.2 sec repetition time) | 1. Target Health Monitor. (non-contact sensor)<br>2. More radiation hardened Beam Loss Monitors (BLMs).<br>3. More radiation hardened Hadron Monitor.<br>4. Pico-second muon monitor.<br>5. Primary Proton Beam monitor. |
| Mu2e     | 8 GeV        | 8 kW (slow extraction beam, 1e9 protons per spill)                              | 1. Target health monitor. (non-contact sensor)<br>2. Use same radiation hardened hadron monitor technology as production target monitor.<br>3. Primary Proton Beam Monitor.  |
| Mu2e-II  | 0.8 GeV      | 100 kW  | 1. Target health monitor.<br>2. Primary Proton Beam Monitor.   |

# Muon Monitors

Three monitor receive different energy muons

Alcove Efficiency due to Shielding

Muon Monitor 1 signal

<https://arxiv.org/pdf/2309.08029.pdf>

# New Instrumentation Ideas

- Large Area Picosecond Photodetector (LAPPD)
  - Use LAPPD as muon monitors, provides muon TOF measurement in alcoves across transverse plane
  - Allows application of precision timing in neutrino experiments
- LAPPDs already offer a space resolution of 1x1 mm and a time resolution of  $\sim 55$  ps or better

## Simulated momentum spectra on central row of MM1

- Individual pixel sees different muon spectrum
- X1 & X9, X2 & X8, X3 & X7, X4 & X6 shows similar shape

## Simulated time-of-flight vs muon momentum at MM1

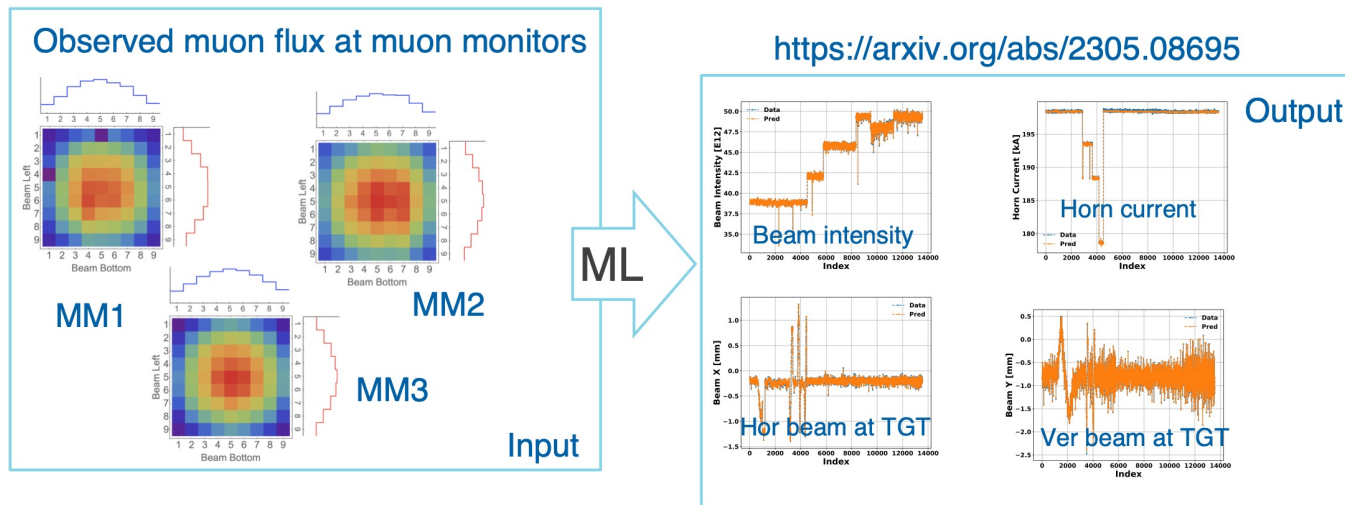

- Observed time distribution will be different at different pixel position

# New Instrumentation Ideas

## Machine Learning for Beam Quality Assessment in NuMI:

- NuMI horn's linear beam optics implies linear response to beam changes.
- ML algorithm with ANN predicts target beam positions.
- Based on 241 observed values, accuracy:  $\pm 0.018$  mm horizontally,  $\pm 0.013$  mm vertically observed
- ML matches traditional instrumentation accuracy

> 1,000 flux images are required for training ML

# Summary

- ACE-MIRT plans to upgrade Main Injector to reduce ramp time and deliver more beam power to DUNE (max  $\sim 2.1$  MW) as soon as possible
- Requires target R&D to ensure that DUNE can handle up to 2.4 MW of beam power
- Need significant R&D efforts focused on radiation-hard beam instrumentation
- Fermilab and KEK/J-PARC accelerator and beamline groups have joined forces – plan to expand

# Backup

# Mass ordering sensitivity with updated beamline scenarios

- Band corresponds to different FD staging scenarios
- This is shown for the **worst case** scenario in other oscillation parameters
- **DUNE determines the mass ordering at  $>5\sigma$  in Phase I no matter what**
- Option 0 pushes milestones earlier by  $\sim 1$  year

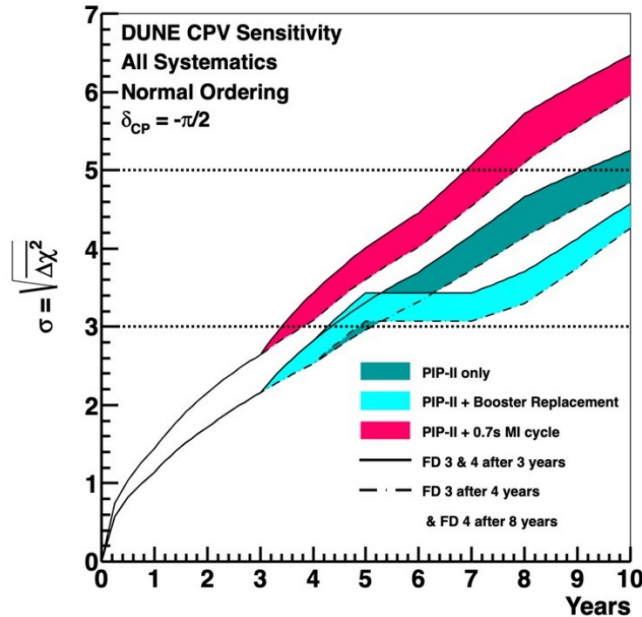

ACE - DUNE Physics

UNIVERSITY of  
ROCHESTER

# CP violation sensitivity for maximal CPV (easiest case)

- Scenario where  $\delta_{CP} = -\pi/2$ , the easiest possible scenario for establishing CPV
- **$3\sigma$  milestone is achieved DUNE Phase I**
- Option 0 pushes milestone forward by  $\sim 1$  year

# CP violation sensitivity in more challenging case: 50% $\delta$ values

- CP violation significance over 50% of possible  $\delta_{CP}$  values, essentially the median significance if you have a flat prior on true  $\delta_{CP}$
- DUNE could be competitive with Hyper-K if  $5\sigma$  can be achieved in 10 years
- Kinks at 6-8 years are due to incorporation of constraint from upgraded Near Detector installed by year 6
- **Option 0 significantly increases DUNE's competitiveness**

ACE - DUNE Physics

UNIVERSITY of  
ROCHESTER

# Even more challenging scenario: 75% $\delta$ values

- CP violation significance over 75% of possible  $\delta_{CP}$  values
- This is the primary physics goal established in the 2014 P5 recommendations
- It is extremely challenging to establish CPV at  $3\sigma$  in this scenario
- **DUNE and Hyper-K are competitive in this scenario, and Option 0 significantly increases DUNE's competitiveness**

ACE - DUNE Physics

UNIVERSITY of  
ROCHESTER
